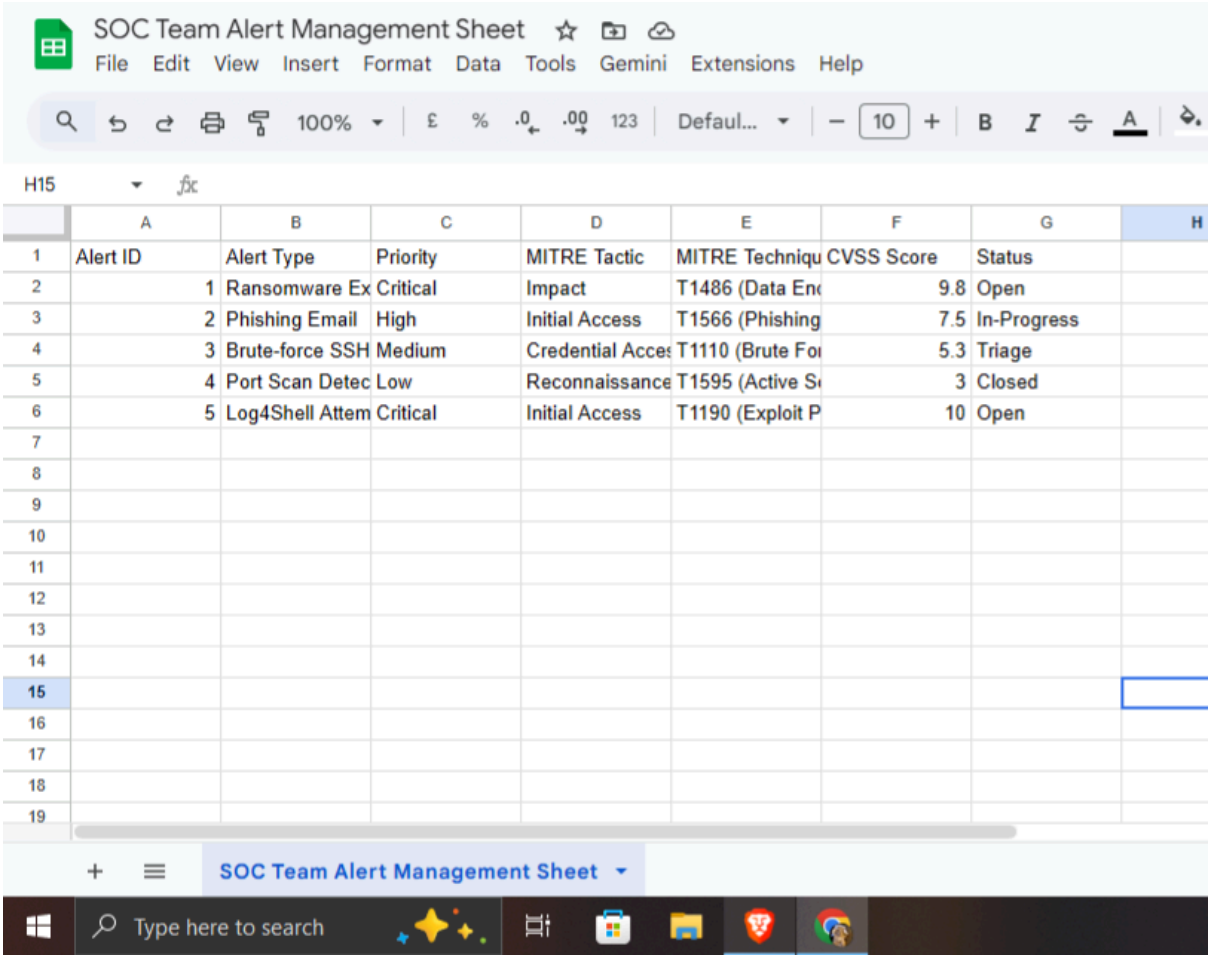
1. Alert Management & Classification System

I have developed a standardized alert classification system using Google Sheets to prioritize incoming security events based on industry metrics (CVSS) and attacker behavior (MITRE ATT&CK).

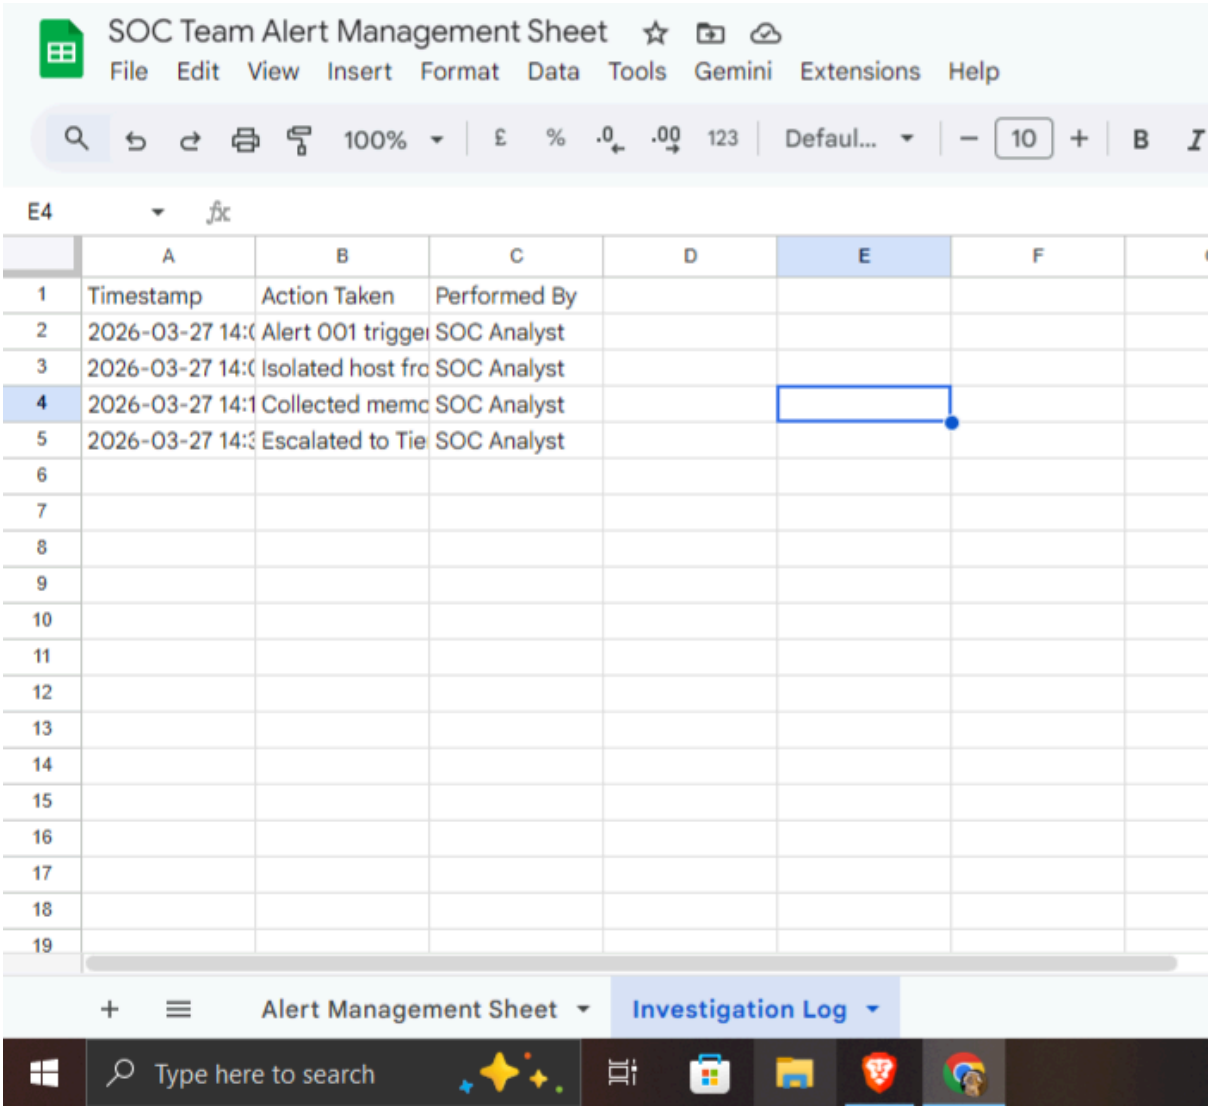


Alert ID	Alert Type	Priority	MITRE Tactic	MITRE Techniqu	CVSS Score	Status
1	Ransomware Ex	Critical	Impact	T1486 (Data En	9.8	Open
2	Phishing Email	High	Initial Access	T1566 (Phishing	7.5	In-Progress
3	Brute-force SSH	Medium	Credential Acces	T1110 (Brute Fo	5.3	Triage
4	Port Scan Detec	Low	Reconnaissance	T1595 (Active S	3	Closed
5	Log4Shell Attem	Critical	Initial Access	T1190 (Exploit P	10	Open

- **Logic Applied:** Critical alerts like Ransomware and Log4Shell are assigned a CVSS of 9.8+ to ensure immediate triage.
- **Taxonomy:** Each alert is mapped to a specific MITRE Technique (e.g., T1566 for Phishing) for standardized labeling.

2. Incident Investigation Log

This log tracks the chronological actions taken by the SOC team during the triage of a Critical Ransomware alert on "Server-X."



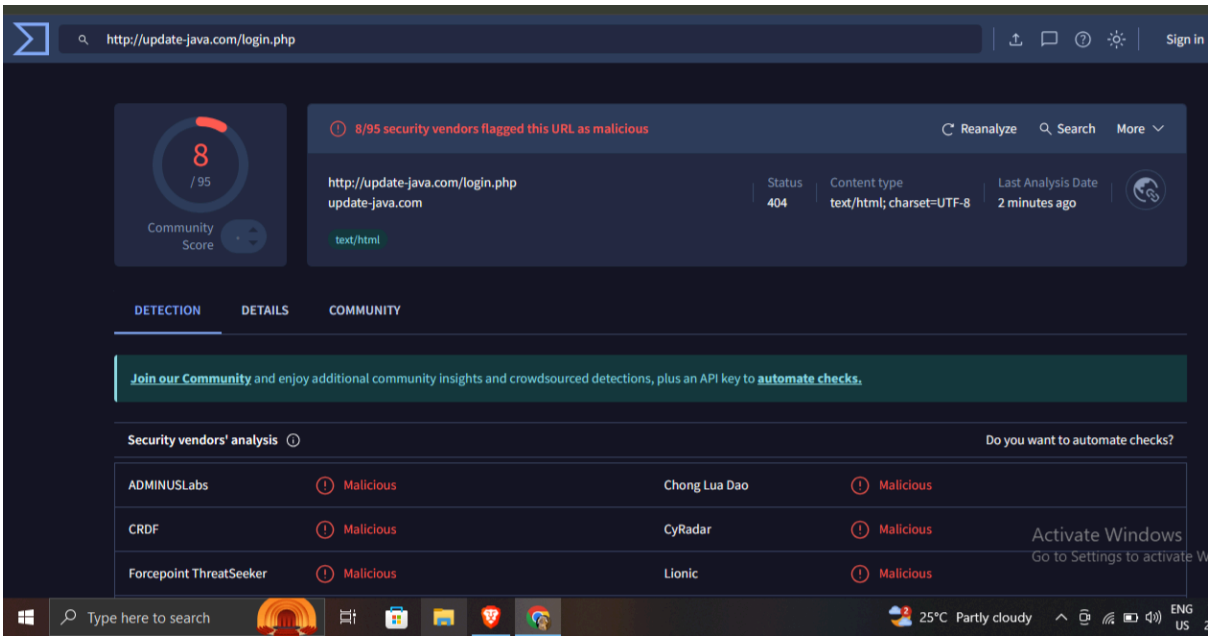
SOC Team Alert Management Sheet

Timestamp	Action Taken	Performed By
2026-03-27 14:(	Alert 001 trigge	SOC Analyst
2026-03-27 14:(	Isolated host fro	SOC Analyst
2026-03-27 14:1	Collected memc	SOC Analyst
2026-03-27 14:3	Escalated to Tie	SOC Analyst

- **Key Actions:** The process includes system isolation to prevent lateral movement and evidence collection (memory dumps) before escalation.

3. Threat Intelligence Validation

To validate the severity of a suspicious link detected in a Phishing alert, I performed a lookup using VirusTotal.



- **Result:** The URL http://update-java.com/login.php was flagged as **Malicious** by 8 security vendors, confirming it as a high-risk threat.

4. Incident Escalation & Reporting

A. Incident Ticket Draft (TheHive Style)

- **Title:** [Critical] Ransomware Detected on Server-X
- **Priority:** Critical
- **IOCs:** Malicious URL detected (https://www.google.com/search?q=update-java.com), source IP 192.168.1.50.
- **Status:** Escalated to Tier 2.

B. Escalation Email (100-word Task)

Subject: URGENT: Escalation of Critical Ransomware Alert (ID: 001)

"Hi Tier 2 Team, I am escalating a Critical alert regarding ransomware detected on Server-X (IP: 192.168.1.50). Our dashboard flagged the execution of 'crypto_locker.exe' at 14:00 IST. Triage confirms a CVSS score of 9.8 and Threat Intel validation via VirusTotal confirms a malicious link associated with this session. I have already isolated the affected endpoint from the network. Please investigate for lateral movement and provide further remediation steps."
